Ceralink Offers Microwave Assist Technology (MAT) Sublicenses to Manufacturers in North America

Albany, NY – Ceralink Inc, a materials engineering and commercialization company, now offers Microwave Assist Technology (MAT) sublicenses to materials and furnace manufacturers in North America.

Ceralink has exclusive license in North America to sublicense Microwave Assist Technology. MAT is a patented technology that decreases furnace cycle time by a factor of 2. This cuts energy consumption by at least 50% for both gas and electric kilns. MAT technology is especially beneficial for firing highly insulating materials that can be difficult to fire.

Other MAT benefits include opportunities for improved properties and new products, including nano ceramics. Existing systems can also be retrofitted.

Ceralink's MAT technology offers furnace manufacturers the ability to stay ahead of the competition through the latest advancements in furnace technology.

Ceralink also offers sublicense packages that include design, construction and commissioning services for building MAT systems. Ceralink provides feasibility testing and materials development for manufacture of materials using MAT technology in our Microwave Testing Center.
