## **Ceralink Grants Microwave Assist Technology (MAT) Sublicense**

Albany, NY – Ceralink Inc, a materials engineering and technology commercialization company, has granted its first Microwave Assist Technology sublicense to a North American furnace manufacturer. Ceralink is providing a one time license to Harrop Industries for the building and sale of a production scale microwave assist electric elevator kiln.

Ceralink is the only authorized source for Microwave Assist Technology (MAT) in North America. MAT is the method and know-how to combine microwave heating with conventional gas or electric furnaces. The simultaneous application of radiant heat and microwave energy offers significant cost savings due to faster processing times, leading to lower energy consumption.

Ceralink offers MAT sublicense packages that include design, construction and commissioning services for building MAT systems. Ceralink provides feasibility testing and materials development for manufacture of materials using MAT technology in our Microwave Testing Center.
